Algorithmic Game Theory
Winter Term 2020/21
Exercise Set 1

If you want to hand in your solutions for this problem set, please send them via email to alexander.braun@uni-bonn.de - make sure to send a pdf-file which contains your name and your email address. Of course, submitting solutions in groups is also possible.

Exercise 1: (6 Points)
Give an example for a symmetric network congestion game (strategies are s-t paths in a directed graph with the same s and t for all players) with monotonically increasing delay functions $d_r$ such that there exist at least two pure Nash equilibria with different social costs. We define the social cost to be the sum of all players’ costs $\sum_{i \in N} c_i(S)$.

Exercise 2: (5+1 Points)
In a weighted congestion game, every player $i \in N$ has an individual weight $w_i > 0$. The delay of a resource $r$ now depends on the sum of the weights – instead of the number of players – of those players who are using $r$. For this purpose, we could redefine $n_r(S)$ to be $n_r(S) = \sum_{i \in S} w_i$ and consider delay functions $d_r: \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}$. Like in the unweighted case the cost of player $i$ is defined as $c_i(S) = \sum_{r \in S} d_r(n_r(S))$.

(a) Prove that weighted congestion games do not fulfil the Finite-Improvement Property, even having only two players, three resources and two strategies for each player.

Hint: Consider $N = \{1, 2\}$, $w_1 = 1$, $w_2 = 2$, $R = \{a, b, c\}$, $\Sigma_1 = \{\{a\}, \{b, c\}\}$, $\Sigma_2 = \{\{b\}, \{a, c\}\}$. Choose delay functions such that

$$(\{a\}, \{b\}) \rightarrow (\{a\}, \{a, c\}) \rightarrow (\{b, c\}, \{a, c\}) \rightarrow (\{b, c\}, \{b\}) \rightarrow (\{a\}, \{b\})$$

is a sequence of best response improvement steps.

(b) Use part (a) to show that a pure Nash equilibrium does not need to exist.
Exercise 3: (1+3+2 Points)
In a consensus game, we are given an undirected graph $G = (V, E)$ with vertex set $V = \{1, \ldots, n\}$. Each vertex $i \in V$ is a player and her action consists of choosing a bit $b_i \in \{0, 1\}$. Let $N(i) = \{j \in V \mid \{i, j\} \in E\}$ denote the set of neighbours of player $i$, i.e., all players $j$ connected to $i$ via an edge. Furthermore, let $\vec{b} = (b_1, \ldots, b_n)$ be the vector of players’ choices. The loss $D_i(\vec{b})$ for player $i$ is the number of neighbours that she disagrees with, i.e.,

$$D_i(\vec{b}) = \sum_{j \in N(i)} |b_j - b_i|.$$

a) Calculate the loss $D_i$ of player 1 for the actions depicted in the graph above.

b) Show that a consensus game represented as an undirected Graph $G$ can also be modeled as a congestion game $\Gamma$. To this end, specify the tuple $\Gamma = (\mathcal{N}, \mathcal{R}, (\Sigma_i)_{i \in \mathcal{N}}, (d_r)_{r \in \mathcal{R}})$ and show that the loss $D_i$ coincides with the cost $c_i$.

c) Prove that in a congestion game modeling a consensus game with $|V| = n$ players all improvement sequences have length $O(n^2)$.
