

Online Motion Planning, WT 13/14  
Exercise sheet 7  
University of Bonn, Inst. for Computer Science, Dpt. I

- You can hand in your written solutions until Tuesday, 10.12., 14:15, in room E.06.

**Exercise 19: Star-shaped streets (4 points)**

A Polygon  $P$  is called *star-shaped*, if there is at least one point  $p$  in  $P$  that can see every other point  $q$  in  $P$ . The set of all those points  $p$  in  $P$  is called the *kernel* of  $P$ .

Let  $P$  be a star-shaped polygon. Prove that for every point  $s$  on the boundary  $\partial P$  of  $P$  there is a point  $t \in \partial P$  such that  $(P, s, t)$  is a street.

**Exercise 20: Streets and angular bisectors (4 points)**

We consider the following simple strategy for finding the target point  $t$  inside a street  $(P, s, t)$ .

Given a triangle defined by the three points  $p$  (the current position),  $v_l$  and  $v_r$  (as defined in the lecture), the robot moves along the *fixed* angular bisector until either  $v_l$  or  $v_r$  changes. In Figure 1, the robot moves in direction from point  $p$  to point  $z$ , until  $v_r$  changes at point  $p'$ .

Analyse the competitive factor of this simple strategy inside *one* triangle, defined by three points  $p, v_l, v_r$  (point  $t$  is hidden just behind one of the two vertices  $v_l$  and  $v_r$ ), assuming  $p = s$  is the starting point.

*Please turn the page!*

Figure 1: Moving along the angular bisector of the current triangle.

**Exercise 21: Angle Hull (4 points)**

Let  $D_1$  and  $D_2$  be two disks bounded by two circles  $C_1$  and  $C_2$  in the plane, where  $D_1 \subset D_2$ . Let  $r_1 < r_2$  denote the radius of  $C_1$  and  $C_2$  respectively; compare Figure 2. The *angle hull* of  $D_1$  is the set of points in  $D_2$  that can

Figure 2: Two disks  $D_1$  and  $D_2$  in the plane.

see two points of  $D_1$  at a right angle.

1. Assuming circles  $C_1$  and  $C_2$  are concentric, what is the boundary of the angle hull of  $D_1$ ?
2. Give a formal description of the angle hull of  $D_1$  and its boundary, if  $C_1$  and  $C_2$  are not necessarily concentric.
3. Prove that the perimeter  $P$  of the angle hull of  $D_1$  is less than  $2\pi\sqrt{2}r_1$  and also less than  $2\pi r_2$ .
